The problem is that I am using `__init__` in a way that extends from the parent class `def __init__(self, *args, **kwargs): super(DerivedClass, self).__init__(*args, **kwargs)` This way I have to override the parent `__init__` method. The constructor works fine. It creates a new object and inserts my code. Problem comes when trying to use methods from the parent class Why is this happening? I mean, I am overriding a method, I should be able to use parent class methods. `class ParentClass(object): def __init__(self, *args, **kwargs): super(ParentClass, self).__init__(*args, **kwargs)` a1d647c40b
